

2004 Annual Water-Quality Report

This brochure is a snapshot of the quality of the water that the City of Wichita provided last year. It meets the federal Safe Drinking Water Act (SDWA) requirement for "Consumer Confidence Reports." Included are details about where your water comes from, what it contains, and how it compares to Environmental Protection Agency (EPA) and state standards. The City of Wichita is committed to providing you with information because informed customers are our best allies. It's important that customers be aware of the efforts that are made continually to improve their water system. Safe water is vital to our community. The City of Wichita asks that landlords, employers, and anyone else who receives the water bill for other water users share this report with them. Please read this report carefully and, if you have questions, call the numbers listed below.

City of Wichita's drinking water surpasses all federal and state drinking-water standards.

The City of Wichita encourages public interest and participation in our community's decisions affecting drinking water. City Council meetings occur on most Tuesdays at 9:00 AM in the City Council Chamber, at City Hall, 455 N. Main. The public is welcome to request time on the agenda for comments about water utility topics.

Consult our Web site at www.wichita.gov and, for further information, see U.S. Environmental Protection Agency (EPA) water information at www.epa.gov/safewater/

El informe contiene informacion importante sobre la calidad del aqua en su comunidad. Traduzcalo o hable con alguien que lo entienda bien.

Water Sources

The City of Wichita is supplied by a blend of surface water from Cheney Reservoir, and groundwater from a well field located in the Equus Beds Aquifer and the City. The City of Wichita treats your water to remove contaminants and the City of Wichita also add disinfectant to protect you against microbial contaminants. An assessment of our source water has been completed. For the results of the assessment, please contact us or download the results at www.kdhe.state.ks.us/nps

How to Read This Table of Water Quality Data

The table shows the results of utility's water-quality analyses. Unless noted otherwise, the data presented in this table is from testing done January 1 – December 31, 2004. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The state requires us to monitor for certain contaminants less than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year. Some of the data, though representative of the water quality, is more than one year old. Every regulated contaminant that we detected in the water, even in the minutest traces, is listed here. The table contains the name of each substance; the highest level allowed by regulation (MCL), the ideal goals for public health, the maximum amount detected (not the average), the usual sources of such contamination, footnotes explaining our findings, and a key to units of measurement. Definitions of MCL and MCLG are important.

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below, which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Action Level (AL): The concentration of a contaminant that, if exceeded, triggers treatment or other requirement that a water system must follow.

Maximum Residual Disinfectant Level (MRDL): The highest level of disinfectant that is allowed in drinking water.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of disinfectant in drinking water below which there is no known or expected risk to health.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water. The data presented in this report is from the most recent testing done in accordance with regulations.

n/a: not applicable n/d: not detected at testing ppb: parts per billion or micrograms per liter ppm: parts per million or milligrams per liter pCi/l: Pico curies per liter (a measure of radiation) NTU: nephelometric turbidity units

REGULATED	COLL							
CONTAMINANTS	DATE	RESULT	RANGE	UNIT	MCL	MCLG	Vio	TYPICAL SOURCE
Arsenic	05/04	1	n/a	ppb	50	50	Ν	Erosion of natural deposits
Barium	05/04	0.038	n/a	ppm	2	2	Ν	Erosion of natural deposits
Fluoride	05/04	0.330	n/a	ppm	4	4	N	Erosion of natural deposits
Selenium	05/04	2	n/a	ppb	50	50	N	Erosion of natural deposits
Nitrate	05/04	0.700	n/a	ppm	10	10	N	Erosion of natural deposits
T. Trihalomethanes	2004	30	25.2-33.8	ppb	80	n/a	N	Byproduct of drinking water chlorination
Haloacetic Acids	2004	12	9.5-19.5	ppb	60	n/a	N	Byproduct of drinking water disinfection
Radionuclide-Gross Alpha	10/01	1	n/a	pCi/l	15	0	Ν	Erosion of natural deposits
					MRDL	MRDLG		
Disinfectant Residual	2004	1.9	1.84-1.97	ppm	4	4	N	Added to drinking water for disinfection
					TT			
Total Organic Carbon	2004	2.26	2.07-2.56		Removal	n/a	N	Naturally present in the environment
					ratio >1			
Turbidity	2004	0.3	n/a	NTU	TT=5 NTU	0	N	Soil runoff
		100	n/a	%	TT **			

^{**}TT=lowest monthly percentage of samples less than or equal to 0.3 NTU

Turbidity is a measure of the cloudiness of the water. We monitor it because it is a good indicator of the effectiveness of our filtration process.

		Sites over						
90th PERCENTILE	DATE					the AL	Vio	TYPICAL SOURCE
Lead	2003	7	n/a	ppb	AL=15	0	N	Corrosion of household plumbing system
Copper	2003	0.012	n/a	ppm	AL=1.3	0	N	Corrosion of household plumbing system

SECONDARY						
CONTAMINANTS	DATE	RESULT	UNIT		Vio	TYPICAL SOURCE
Calcium	05/04	23	ppm	75-200	N	Erosion of natural deposits
Magnesium	05/04	14	ppm	50-150	N	Erosion of natural deposits
Sodium	05/04	89	ppm	100	N	Erosion of natural deposits
Potassium	05/04	4	ppm	100	N	Erosion of natural deposits
Chloride	05/04	111	ppm	250	N	Erosion of natural deposits
Sulfate	05/04	77	ppm	250	N	Erosion of natural deposits
Total Hardness	05/04	116	ppm	400	N	Erosion of natural deposits
Alkalinity as CaCO3	05/04	78	ppm	60-300	N	Erosion of natural deposits
рН	05/04	7.05	pH units	6.5-8.5	N	Erosion of natural deposits
Specific Conductivity	05/04	661	umho/l	1500	N	Erosion of natural deposits
Tot. Dissolved Solids	05/04	376	ppm	500	N	Erosion of natural deposits
Total Phosphorous (P)	05/04	0.040	ppm	5	N	Erosion of natural deposits
Silica	05/04	8	ppm	50	N	Erosion of natural deposits
Iron	05/04	0.013	ppm	0.3	N	Erosion of natural deposits

Unregulated Contaminants

Cryptosporidium is a microbial pathogen found in surface water throughout the U.S. Although filtration removes cryptosporidium, the most commonly used filtration methods cannot guarantee 100 percent removal. Our monitoring indicated the occasional presence of these organisms in our source water, but not in the treated water. Current test methods do not allow us to determine if the organisms are dead or if they are capable of causing disease. Ingestion of cryptosporidium may cause cryptosporidiosis, an abdominal infection. Symptoms of infection include nausea, diarrhea, and abdominal cramps. Most healthy individuals can overcome the disease within a few weeks. However, immuno-compromised people are at greater risk of developing life-threatening illness. We encourage immuno-compromised individuals to consult their doctor regarding appropriate precautions to take to avoid infection. Cryptosporidium must be ingested to cause disease, and it may be spread through means other than drinking water.

The U.S. Environmental Protection Agency's Unregulated Contaminant Monitoring Rule required the City of Wichita public water supply to monitor for the unregulated contaminants listed in the rule. The required monitoring has been completed and the results are available by calling 316-265-1300.

Required Additional Health Information

To ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. We treat our water according to EPA's regulations. Food and Drug Administration regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791).

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

- (A) Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- (B) Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban storm runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- (C) Pesticides and herbicides, which may come from a variety of sources such as agriculture, stormwater runoff, and residential uses.
- (D) Organic chemical contaminants, including synthetic and volatile organics, which are by-products of industrial processes and petroleum production, and can, also come from gas stations, urban stormwater runoff, and septic systems.
- (E) Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.

Some people may be more vulnerable to contaminants in drinking water than is the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium are available from the Safe Drinking Water Hotline (800-426-4791).

Search for Excellence

The Wichita Water & Sewer utility has joined the Partnership for Safe Water, a national initiative to help achieve operational excellence in water treatment. The partnership was developed through cooperation among the U.S. Environmental Protection Agency (EPA), states, and water supply associations to provide better protection for consumers from microbial contaminants that can cause intestinal illness.

National Primary Drinking Water Regulation Compliance
